single individual that either had alleles to avoid being seen by predators or the ability to adhere to a specific pattern or strategy that was more successful than others.

If a certain increase in the frequency of an adaptive trait is due to chance rather than to the action of natural selection, the frequency of the trait will increase in proportion to the number of individuals in the population. If the change is due to natural selection, the frequency of the trait will increase in proportion to the number of individuals that survive and reproduce.

The difference between the two is that natural selection is a process that acts on the variation of individuals in a population. It is the differential survival and reproduction of individuals with certain heritable traits that leads to the evolution of a population.

The differential survival and reproduction of individuals with certain heritable traits is the result of natural selection. It is the process by which the frequency of a trait in a population changes over time.

The differential survival and reproduction of individuals with certain heritable traits is the result of natural selection. It is the process by which the frequency of a trait in a population changes over time.

**Evolution in Medicine: Combating New Infectious Diseases**

In the 19th century, the discovery of germs led to the development of antibiotics. However, the overuse of antibiotics has led to the emergence of antibiotic-resistant bacteria. This is an example of evolution in action.

Antibiotic resistance is the ability of a bacterium to resist the effects of an antibiotic. This is a survival advantage for the bacterium. The more bacteria that survive, the more they can reproduce and pass on their resistant genes.

The evolution of antibiotic resistance is a result of natural selection. Bacteria with resistant genes survive and reproduce more successfully than those without. Over time, the frequency of resistant genes in the population increases.

The evolution of antibiotic resistance is a result of natural selection. Bacteria with resistant genes survive and reproduce more successfully than those without. Over time, the frequency of resistant genes in the population increases.

**Excerpts of Statements by Scientists**  
What Do You Consider Evidence That Earth and Science

Scientists like people in other professions, hold a wide range of opinions about religion and the role of supernatural forces or entities in the natural world. Some believe that scientific research can provide answers to all questions about the natural world, while others believe that there are some questions that science cannot answer. Some scientists believe that God created all things and that the universe is a result of divine intervention, while others believe that the universe is a result of natural processes.

"I certainly wouldn't see the God of the Bible as a deity who intervenes in the natural world. I would see God as a power source or an active force in the natural world, but not as a deity who intervenes in the natural world."

"I'm not a scientist, but I think it's important to understand that science is a process, not a body of knowledge. It's a way of thinking that allows us to test our ideas and see if they hold up to the evidence. It's a way of thinking that allows us to change our minds when the evidence tells us to. It's a way of thinking that allows us to understand the world around us in a way that is based on evidence, not on faith or tradition."

"Our scientific understanding of the universe allows us to understand the world around us in a way that is based on evidence, not on faith or tradition. It allows us to understand the world around us in a way that is based on evidence, not on faith or tradition. It allows us to understand the world around us in a way that is based on evidence, not on faith or tradition."
